

# Item Sync Integration

Amit Book Depot → Multiply AI · WhatsApp Ordering

**Our side is complete.** Built to your published Item Sync specification, tested end to end, and running live 24×7 on our own infrastructure. We can publish our full catalogue on the day you issue our API key.

TO SYNC THE FULL  
CATALOGUE

**129 / 129**

BATCHES ACCEPTED · ZERO  
ERRORS

**24 × 7**

LIVE, SELF-UPDATING  
SERVICE

## 01 WHAT WE HAVE ALREADY BUILT

A dedicated integration service that reads our live ERP and pushes our item master to your endpoint `PUT /v2/items/sync-data`, authenticated with `x-api-key`, exactly as documented.

- **Live and hosted by us.** Deployed on our own infrastructure and monitored around the clock — no manual upload, no spreadsheet, no daily intervention from either side.
- **Always current.** The complete catalogue re-syncs every night and stock levels refresh every 30 minutes, so a WhatsApp buyer always sees real, present-day availability and pricing.
- **Built for scale.** Items are sent in batches with automatic retry and exponential backoff, and we honour `Retry-After` — we will never overwhelm your API.
- **We read your responses properly.** Your partial-failure envelope is parsed and every entry in `errors[]` is mapped back to the exact ISBN, so any data issue is corrected at source within minutes rather than investigated for days.
- **Continuously delivered.** Every code change is automatically tested and released to production, so the integration stays healthy without scheduled downtime.

## 02 HOW OUR DATA MAPS TO YOUR SPECIFICATION

One book becomes one item, with one SKU and one base selling unit — books carry no size or colour variants.

| YOUR FIELD                                     | WHAT WE SEND                                                           |
|------------------------------------------------|------------------------------------------------------------------------|
| <code>itemName · skuName</code>                | Book title                                                             |
| <code>brandName</code>                         | Publisher                                                              |
| <code>categoryName · subCategoryName</code>    | Category and subject, with a safe fallback so no item is ever rejected |
| <code>syncId (item &amp; SKU)</code>           | ISBN — permanent, globally unique, never reused                        |
| <code>sellerSKU · productCode · barCode</code> | ISBN — barcode sent only where it is a valid ISBN-10/13                |
| <code>hsnCode · gst</code>                     | 4901 and 0 — books are GST-exempt in India                             |
| <code>variantType1 · variantType2</code>       | Binding (Paperback / Hardback) and Language                            |
| <code>sellingUnits</code>                      | PCS, multiplier 1 — MRP, selling price and live stock quantity         |

### 03 TESTING ALREADY COMPLETED

- **32 automated tests** covering field mapping, validation, retry behaviour and error handling — all passing on every release.
- **Full-scale rehearsal.** Our entire catalogue was pushed to a local replica of your endpoint, built strictly to your published specification: **38,513 items across 129 batches, every batch accepted, zero errors, in 74 seconds.**
- **Repeat-run verified.** Re-syncing the same catalogue updates the existing records rather than duplicating them, confirming correct create-or-update behaviour on `syncId`.
- **Pre-flight validation mirrors your own checklist** — required fields, numeric prices and globally unique sync IDs — so invalid rows never reach your API. In the rehearsal it correctly held back two titles with incomplete pricing in our records.

### 04 WHAT WE NEED FROM MULLTIPLY

#### Our API key

A production `x-api-key` — and a sandbox key first, if you provide one. This is the only outstanding item between us and go-live.

#### And five short confirmations:

- 1 **Rate limits and maximum batch size.** We currently send 300 items per request, spaced 500 ms apart. Tell us your preferred limits and we will match them.
- 2 **GST of 0.** Books are GST-exempt in India. Please confirm `0` is accepted, or tell us which GST group code you expect instead.
- 3 **Variant labels.** We send `Binding` and `Language` in place of `Size` and `Colour_Name`. Please confirm these display correctly to buyers.
- 4 **Delisting.** The API has no delete operation. How should a title be retired — is re-syncing it with `availableQuantity: 0` the accepted convention?
- 5 **Row indexing.** In partial-failure responses, is `errors[ ].row` 0-based or 1-based? We handle both, but would prefer to be certain.

### 05 GO-LIVE PLAN — ONE WORKING DAY

#### STEP 1

Key installed in our secure configuration — five minutes, no deployment needed.

#### STEP 2

Single-title test sync; you confirm it appears correctly in your panel.

#### STEP 3

We change that title's price and re-sync, confirming the update lands cleanly.

#### STEP 4

50-title batch, then the full catalogue; nightly automatic sync switched on.

*A sample payload is available on request — we can send you the exact JSON we will PUT to your endpoint, generated live from our catalogue, before a single record is written.*
