

Selling-Unit syncId — Switchover Plan

Amit Book Depot → Multiply AI · requesting your go-ahead

01 WE ARE READY ON OUR SIDE

As requested, our Item Sync payload now includes **syncId** inside every **sellingUnits** object, using the **same value as the SKU-level syncId** (the book's ISBN / item code).

The change is implemented and fully tested against your specification — it is **built but intentionally not deployed yet**, so that nothing reaches your system until the switchover below is agreed.

Every book has exactly one SKU and one base selling unit, so each item carries one identical identifier at all three levels — please use the **SKU-level syncId** as the value in your manual backfill.

```
{
  "name": "PCS",
  "multiplier": 1,
  "mrp": 95,
  "sellingPrice": 95,
  "availableQuantity": 1,
  "isBaseUnit": true,
  "isDefault": true,
  "includeGST": true,
  "syncId": "0002720671",
  "isActive": true
}
```

02 PROPOSED SWITCHOVER — ZERO DUPLICATE RISK

Since an item-sync without unit syncId after your backfill could create duplicate selling units, we will **pause all automatic syncs for the duration of your backfill**. Nothing is lost — pending price/stock changes flow the moment we resume.

STEP	MULLTIPLY AI	AMIT BOOK DEPOT
1 · Start	Tell us you are starting the backfill	We immediately pause our scheduler — no syncs while you work
2 · Finish	Tell us the backfill is complete	We deploy the new payload and run one full sync (all items carry unit syncIds)
3 · Verify	Confirm items show no duplicate selling units	We re-enable automation — nightly full 02:00 IST + 30-min change-only deltas

03 WHAT WE NEED FROM YOU

Your go-ahead for the plan above, and the two notifications in steps 1 and 2 (a WhatsApp message is fine). We act within minutes of each message — the pause window is only as long as your backfill takes.

Once live, we also plan to adopt your inventory API (POST /v2/godowns/thirdparty-stock-sync) for our 30-minute stock refreshes — sending compact {syncId, inventoryQuantity} batches instead of full item objects, which should reduce the load on your ingestion queue substantially. We will coordinate that separately after this switchover is verified.
